Incident report: manufacturer ransomware via vpn

At Desert Steel Manufacturing the remote access gateway had not been patched for CVE-2023-4966. Attackers took over an authenticated session on it, moved to internal servers using Remote Desktop, and uploaded engineering drawings to a cloud storage account. After the data was gone they encrypted the production servers and posted a sample of the stolen files on their leak site, demanding a ransom. Plant manager Yousef Al-Amri reported it from 10.40.12.8.
